

MSP Diesel Solutions – Route Management Application

Requirements Specification Document

1. Project Overview

MSP Diesel Solutions and Prometheus Agency will design, develop, and deploy a Route Management Application — a mobile-friendly web platform that integrates directly with HubSpot CRM. The goal is to help field sales representatives efficiently plan, execute, and log customer visits through location-based intelligence, route optimization, and AI-assisted data capture.

2. Objectives

1. Provide a map-based interface recommending optimal travel routes.
2. Enable accurate, location-verified check-ins that sync automatically to HubSpot.
3. Allow voice-to-text visit logging with AI parsing of unstructured notes into structured CRM data.
4. Enhance territory visibility for leadership through real-time data.
5. Maximize ROI on HubSpot by leveraging existing CRM data for decision-making.

3. Functional Requirements

3.1. Core Features

Feature	Description	Integration
Bi-Directional HubSpot Sync	Two-way integration for Companies, Addresses, and Activities	HubSpot API
GPS Detection & Radius Search	Detect user location or allow manual entry of city/radius to find nearby accounts	Mapbox / Location Services
Route Optimization	Generate optimized travel paths between customer visits	Route algorithm
Check-In Logging	Log location-verified visits automatically in HubSpot	HubSpot Activities / Custom Object
Voice-to-Text Capture	Enable reps to record one voice note per visit	Integrated AI model (Speech-to-Text)
AI Data Extraction	Parse notes into structured fields (e.g., engine type, vehicle presence, customer needs)	AI model hosted on GCP

Review & Submit Flow	Display parsed data for rep confirmation before final submission	Frontend UI
Daily Summary View	Provide an overview of daily visits, mileage, and notes	Internal reporting module
Authentication	Standard username/password login	Secure managed auth (Google Identity or custom)
Admin & API Docs	Documentation for MSP's internal technical reference	Prometheus deliverable

3.2. User Roles & Permissions

Role	Capabilities
Sales Representative	Access app, plan routes, record notes, check in/out, review data
Sales Manager	View team coverage, visit frequency, and daily summaries
Admin (MSP HQ)	Manage users, review logs, oversee HubSpot sync health

4. User Experience

The Route Management Application is designed to be mobile-first, simple, and field-friendly — ensuring sales reps can plan and record their work without friction.

4.1. Typical User Flow

1. Login: The user logs in via secure credentials on their mobile browser or device home screen shortcut.
2. Plan Route:
 - a. The app detects current GPS location (or allows manual city input).
 - b. Reps view nearby accounts filtered by radius or city.
 - c. The system suggests an optimized route based on selected accounts.
3. During Visits:
 - a. The user “checks in” upon arrival — automatically verifying location.
 - b. The app logs the visit to HubSpot.
4. After Visit (Voice Capture):
 - a. The rep records one short voice note describing visit insights.
 - b. The AI processes and parses the note into predefined CRM fields (e.g., customer type, services discussed, product interest).
5. Review & Submit:
 - a. Parsed data appears in a review screen for quick confirmation or editing.
 - b. Once submitted, all details are written back to HubSpot automatically.
6. End of Day Summary:

- a. Reps can review a summary of all visits, mileage, notes, and check-ins.
- b. Sales managers can review team-wide activity summaries within HubSpot.

5. Data Capture & Confirmation Needed

The following information will be stored in the HubSpot Custom Object (Sales Visits). All fields are required before submission. However, Prometheus requests MSP's input to confirm the exact set of questions sales reps should be asked post-visit.

5.1 Key Questions for Post-Visit Data Collection

Field	Description	Example Values
Machinery Types	What type of machinery the customer works on.	Light duty trucks / Medium duty / Heavy duty
Engine Types	Specific engines currently in their shop.	CAT C15, Cummins ISX, Detroit Series 60
Fleet Makeup (if applicable)	Truck or equipment brands represented in their fleet.	Freightliner, Ford, Chevrolet, Mack, Volvo
Current Suppliers	Vendors currently providing parts or services.	NAPA, FleetPride, OEM dealer
Competitor Data	Which competitors they use and what they're paying.	"Uses Diesel X for injectors at \$450 each."
Pricing Information	Prices currently paid for relevant products.	Per-unit or bulk pricing notes entered by rep.
Specific Product Models	Capture precise model information rather than generic product names.	"55-75 injectors" instead of "60 Series injector."
Product Availability Gaps	Note when suppliers are out of stock or delayed.	"Bosch constantly back-ordered on these."
Customer Needs Assessment	What the customer does and what they need next.	"Needs help finding Cummins reman injectors."
Our Competitive Position	Where MSP can compete or add value.	"We can beat price and lead time on Bosch kits."
Inside Sales Issues	Any issues with MSP's inside sales team impacting the relationship.	"Delayed quotes causing frustration."
Next Steps	Defines follow-up actions (e.g., quote, call, site visit).	

Miscellaneous Notes	Additional context that doesn't fit elsewhere.	
GPS Coordinates, Timestamp, Duration	Auto-captured by the app at check-in.	

Form Structure Notes:

- The post-visit form will contain all fields above, each required.
- Voice notes will feed AI parsing for pre-filling fields, but the rep must confirm values.
- The “Next Steps” field will trigger creation of follow-up tasks in HubSpot when appropriate.

6. Technical Requirements

Area	Description
Hosting	Deployed on Google Cloud Platform
Database	Firestore or SQL backend
Frontend Framework	Mobile-first progressive web app
Integration Layer	HubSpot APIs for Companies, Activities, and Custom Objects
AI Processing	Speech-to-Text and data parsing logic hosted on GCP AI/ML services
Authentication	Secure login; optional OAuth for future enhancements
Subdomain	TO BE CONFIRMED /CREATED BY MSP

7. Success Metrics

95% Data Completeness: All Sales Visit records in HubSpot include every required post-visit field (customer data, competitive intel, and next steps).

90%+ AI Parsing Accuracy: Voice-to-text feature correctly extracts and structures visit data with minimal manual edits.

85% Weekly Active Adoption: At least 85% of field sales reps use the Route Management App weekly for visit logging.

15% Increase in Logged Customer Visits: Reps record more total visits compared to pre-launch baseline, indicating higher activity visibility and operational efficiency.
